How to erase and reset android phone. How to erase your android phone remotely. How to erase stuff off your android phone. How to completely erase an android phone. How do i erase everything on my android phone. How to safely erase android phone. How to properly erase android phone.

Android phones are some of the most customizable and versatile devices on the market. Whether you're a photographer, a power user, or just looking for a phone to get the job done, there's an Android device out there for you. With this wide range of options, it can be quite overwhelming to pick one Android phone for yourself. To help, here are the best Android phones available today. Google Pixel 4a Price: \$349 (non-5G); \$499 (5G) 5G: Only in the 5G version This mid-range phone by Google boasts a decent camera, sophisticated design, and solid software. It's an excellent option for gamers and photographers alike who aren't looking to spend extra on a flagship phone but still want respectable performance. One of the Pixel 4a's biggest advantages over its competitors is its three-year software update guarantee. Unlike many other low-priced Android phones, Google offers OS and security updates that extend the life of the phone. The Pixel 4a comes with features like a native Recorder app, an updated messaging app with an iMessage feel, and an 18W fast-charging adapter in the box. From playing music to pulling up Twitter profiles, Google Assistant provides a quick-and-easy way to get many things done without even unlocking your device. Specs CPU: Qualcomm Snapdragon 730G (non-5G); Qualcomm Snapdragon 765G (5G) Screen Size: 5.8 inches (non-5G); 6.2 inches (5G) Screen Resolution: 1080 x 2340 Front Camera Resolution: 8MP Rear Camera Resolution: 12MP dual-pixel (non-5G); 12MP dual-pixel and 16MP ultrawide Memory: 6GB Storage Capacity: 128GB Battery Life: 9 Hours Motorola Moto G Power Price: \$249 5G: No With some of the best battery life available anywhere and decent performance, the Motorola Moto G Power is one of the best budget phones you can buy. Its \$249 price tag makes it among the least expensive smartphones from the major manufacturers. Better yet, its upgraded design and solid 6.6-inch display mean you get more for your money. The Moto G Power has 4GB of RAM and is powered by a Qualcomm Snapdragon 665 octa-core processor. Although it's not as powerful as more expensive phones, the phone still performs well when playing games or watching videos. Specs CPU: Qualcomm Snapdragon 662 Screen Size: 6.6 inches Screen Resolution: 1600 x 720 Front Camera Resolution: 8MP Rear Camera Resolution: 48MP Memory: 3GB Storage Capacity: 32GB, expandable up to 512GB Battery Life: Up to 3 Days OnePlus 8 Pro Price: \$799 5G: Yes, with T-Mobile What really makes the OnePlus 8 Pro stand out is its incredible display quality. Even at the battery-saving 60Hz, this phone's screen has incredible color-accuracy and brightness. Kick it up a notch to 120Hz, and the 2K AMOLED screen really shines. Especially considering its powerful screen, the 8 Pro has good battery life. If you do run out, the Warp Charge 30T comes in the box and can fill the battery in less than an hour. Unlike most other phones at the same price range, the OnePlus 8 Pro does not offer universal 5G compatibility. You can access top 5G speeds if you use T-Mobile, but Verizon and AT&T users are stuck with 4G speeds. Specs CPU: Qualcomm Snapdragon 865 Screen Size: 6.78 inches Screen Resolution: 3168 x 1440 Front Camera Resolution: 16MP Rear Camera Resolution: 48MP Memory: 8 or 12GB Storage Capacity: 128 or 256GB Battery Life: 10 hours Samsung Galaxy Note20 Price: \$999.99 5G: Yes The Samsung Galaxy Note20 was released as a cheaper alternative to the Ultra version, coming in at just under \$1,000. As a result, it doesn't come with many of the features that the Ultra boasts. Despite that, it retains enough of these features to remain a solid option for those looking to spend a grand on an Android phone. The Note20 does support the Samsung S Pen. So, if that's what you're most invested in, this phone is a cheaper way to get one than the Ultra. Compared to its more expensive sibling, this phone has slightly worse performance, with 8GB of RAM and a Qualcomm Snapdragon 865+ chipset. It features a respectable camera with two 12MP lenses and a 120-degree ultra-wide lens, making it suitable for most every-day users. Like the Ultra, it can also record video in optically stabilized 8K. Specs CPU: Qualcomm Snapdragon 865+ Screen Size: 6.7 inches Screen Resolution: 2400 x 1080 Front Camera Resolution: 10MP Rear Camera Resolution: 12MP ultrawide, 12MP wide-angle, 64MP telephoto Memory: 8GB Storage Capacity: 128GB Battery Life: 12 Hours Samsung Galaxy Note20 Ultra Price: \$1,299.99 5G: Yes The Samsung Galaxy Note20 Ultra was widely crowned as the best Android phone in 2020 and for good reason. With a bright, beautiful display, lightning-fast performance, and the excellent S Pen, the Note20 Ultra is both a phone and an all-in-one productivity tool. The phone comes with 12GB of RAM, expandable storage, and a Snapdragon 865+ processor. As a result, it's snappy and easy to use for everything from streaming movies to playing games. Where the Ultra really shines is in its beautiful display and S Pen compatibility. One of the first phones to adopt a 120Hz screen, it displays detail and color at an incredible level. Specs CPU: Qualcomm Snapdragon 865+ Screen Size: 6.9 inches Screen Resolution: 3088 x 1440 Front Camera Resolution: 10MP Rear Camera Resolution: 12MP ultrawide, 108MP wide-angle, 12MP telephoto Memory: 12GB Storage Capacity: 128 or 512GB, expandable up to 1TB Battery Life: 12 Hours Samsung Galaxy S21 Ultra Price: \$1,199.99 5G: Yes The Samsung Galaxy S21 Ultra justifies its high price tag with a truly impressive array of features. This includes five cameras, universal 5G compatibility, and S Pen support. Redesigned with a new contour-cut body and five cameras, the S21 Ultra is built to impress. It's the first Galaxy S phone to offer compatibility with the excellent S Pen, making it an excellent option for artists and notetakers alike. With a 120Hz 2K AMOLED display, images are bright and color accurate. This feature is especially appreciated when viewing photos taken with the phone's impressive camera, which offers a zoom of up to 10 times and beautiful contrast, autofocus, and stabilization. The Galaxy S21 Ultra is compatible with a huge range of 5G frequencies, including all current networks and even some that haven't come into use yet. In that respect, it's an excellent investment for those who are highly interested in testing out new 5G technology as soon as possible. Specs CPU: Qualcomm Snapdragon 888 Screen Size: 6.8 inches Screen Resolution: 3200 x 1400 Front Camera Resolution: 40MP Rear Camera Resolution: 108MP wide, 12MP ultrawide, 12MP wide-angle, two 10MP telephoto Memory: 12 or 16GB Storage Capacity: 128, 256, or 512GB Battery Life: 11.5 Hours So you've just bought a new phone. You want to sell your old phone, but you're worried about the buyer finding personal information on it. That's smart — you can never be too careful. Here's how to remove all that personal data before handing the phone over to a stranger. First, back up all your data and transfer important files to your new phone. This should include pictures, documents, apps (with logins) and media (music, videos and e-books). Some platforms, such as Apple's iOS and Google's Android, and carrier networks, such as Sprint, provide backup services. If you need a quick online-backup service, we recommend using apps like Dropbox or Google Drive. Next, delete everything from storage media. Usually, this just means formatting the microSD card, if your phone has one. Most phones have an option somewhere in the settings menu to format the memory card. This wipes the data completely. Another option is to simply remove the microSD card and use it for your new phone, as long as the new phone accepts storage media (iPhones and many Android phones don't) and you make it clear to potential buyers that a microSD card isn't included with the phone you're selling. Most devices are synced up with any number of social accounts, including Apple, Google, Facebook and Twitter. Sometimes these accounts will use permissions, a phone number or a device ID to sync up with your device. We recommend checking your Apple, Google and Facebook account settings and removing this particular data from the account. The next, and most important, step is to perform a factory data reset, also known as a factory wipe or hard reset. In essence, the factory reset removes any personal data and apps and returns the phone to the default state the phone was in when you purchased it. 1) Open your Settings app and click General. 2) Tap Backup And Reset. 3) Tap Factory Data Reset. This function will reset all your settings and remove all personal data from your phone. 4) Confirm that the phone can delete the listed data. After you activate Factory Data Reset, your device will list what data it will delete. For example, some phones will not delete photos unless you opt to do so. If you need to backup files, Android can use Google Drive to provide support. If you accept, the system will reboot and return to factory settings. Pro Tip: Many Android phones have additional device-specific methods for performing a factory reset. Some use particular codes to do a full reset, others have specific button combinations for shutting it off. Check with your phone's designer to determine what method will work for you. 1) Make sure you've backed everything up: Apple can use iCloud to save various features, including settings, contacts, and music. 2) Tap the Settings app and select General. 3) Tap Reset. It can be found at the bottom of General menus. 4) Push "Erase all content and settings". If you've locked your iPhone settings, you will have to re-input your security code. Make sure you've lost your code or want to sync your phone directly with your computer, you can perform a factory data reset by connecting the phone to a computer and using iTunes. 1) Open iTunes and sync your iPhone with your computer. 2) Click on the iPhone List. 3) Choose Restore. 4) Make sure you back up your phone if you need to. 5) Restore Your Phone. All data will be removed, and factory settings will be restored. Windows Phones 1) Access your App List. You can access that by swiping to the left on the main menu scrolling down the list. 2) Tap Settings. Your settings can be found on your app list. 3) Tap About. You can find this at the bottom of your settings. 4) Tap Reset Your Phone. You will then receive two warnings, requiring you to recognize your actions. Pro Tip: There are also methods to perform a hard reset using just physical buttons (volume and camera buttons, for instance), but they vary based on manufacturer and model, so you'll need to look up the method for your specific device. If you're truly paranoid: Even after a factory reset, forensic tools used by law enforcement agencies can go into a phone (or hard drive) and retrieve data that isn't written over. To make sure everything's unreadable, the data should be encrypted before a factory reset is performed. If you have an iPhone and you've set a screen-lock PIN, your phone is already encrypted. Strengthen that encryption by replacing the PIN with a longer alphanumeric password. Here's how. If you're on an Android phone, here's how to encrypt it. Finally, remove the phone's SIM card, even if you won't need it any more. It may contain lots of your personal information, such as text messages, recent calls and contacts, all of which could easily be read. If you're switching from one phone to another on the same carrier, or moving to an unlocked phone, you may be able to simply transfer the SIM card to the new phone.
